REPORTS, DASHBOARDS AND UI BUILDER

AIM

To create reports and a dashboard in Zoho Creator to view and analyse the stored data, and to customize the user interface of the application using UI Builder, for the Student Management System application.

SOFTWARE / TOOLS USED

- Zoho Creator (Low-Code Application Development Platform)
- Web browser (Google Chrome / Microsoft Edge)

THEORY

A Report in Zoho Creator displays the records stored in a form. Reports can be of different types such as List, Grid, Kanban, Calendar and Pivot, and support sorting, filtering and grouping of records. A Dashboard combines several components such as KPIs, charts and reports in one screen, so that the important information of the application can be viewed at a glance. UI Builder is the visual designer of Zoho Creator, used to arrange the layout of forms, reports and dashboards and to customize the look of the application, such as its theme, colours and logo, without writing code.

REPORTS AND DASHBOARD COMPONENTS

The following reports and dashboard components are created in the "Student Management System" application:

Name	Type	Source Form	Purpose
Student_List	List Report	Students	Lists all students, grouped by Department
Enrollment_Result_Board	Kanban Report	Enrollment	Shows enrollments grouped by Result
Total Students	KPI	Students	Count of all student records
Students Passed	KPI	Enrollment	Count of records where Result = Pass
Students by Department	Bar Chart	Students	Number of students in each Department
Recent Enrollments	Report component	Enrollment	Latest enrollment records on the dashboard

PROCEDURE

A. Creating Reports

1. **Open the application:** Sign in to Zoho Creator, open the "Student Management System" application (Edit mode) and view the default reports created for the forms Students, Courses and Enrollment.

2. **Create a List report:** Click Create → Report, select the form "Students", choose the report type List, and name it "Student_List". Select the columns (Roll_No, Student_Name, Department, Email) to be displayed.

3. **Apply grouping, sorting and filters:** In the report settings, set Group By as Department, Sort By as Student_Name, and add a Quick View filter on Department. Save the report and open it in live mode to check the output.

4. **Create a Kanban report:** Create another report on the form "Enrollment", choose the type Kanban, group the cards by Result (Pass / Fail) and name it "Enrollment_Result_Board".

B. Creating the Dashboard

5. **Create a dashboard:** Click Create → Dashboard and name it "Student_Dashboard". An empty canvas with a components panel opens.

6. **Add KPI components:** Drag the KPI component onto the canvas twice. For the first KPI select the form Students and the function Count, and name it "Total Students". For the second, select the form Enrollment, function Count, with the condition Result = Pass, and name it "Students Passed".

7. **Add a chart:** Drag the Chart component, select the type Bar, choose the form Students, set the category axis as Department and the value as Count of records. Name it "Students by Department".

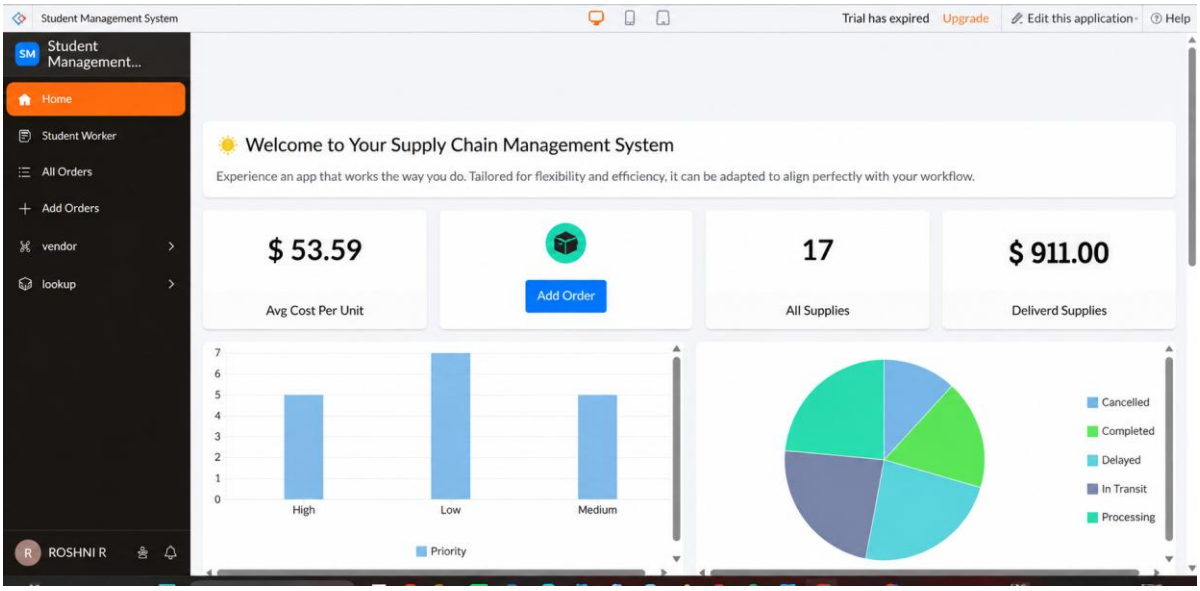

8. **Add a report component and arrange the layout:** Add a Report component, select the report Enrollment_Result_Board (or a list report of Enrollment) and name it "Recent Enrollments". Arrange and resize all components, then click Save.

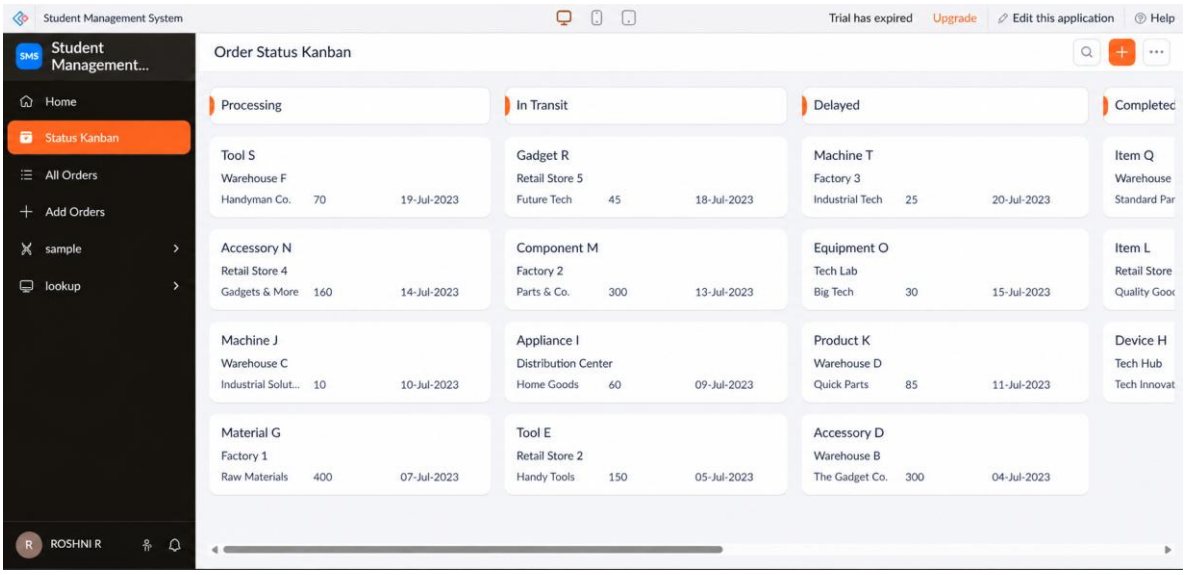

C. Customizing the UI using UI Builder

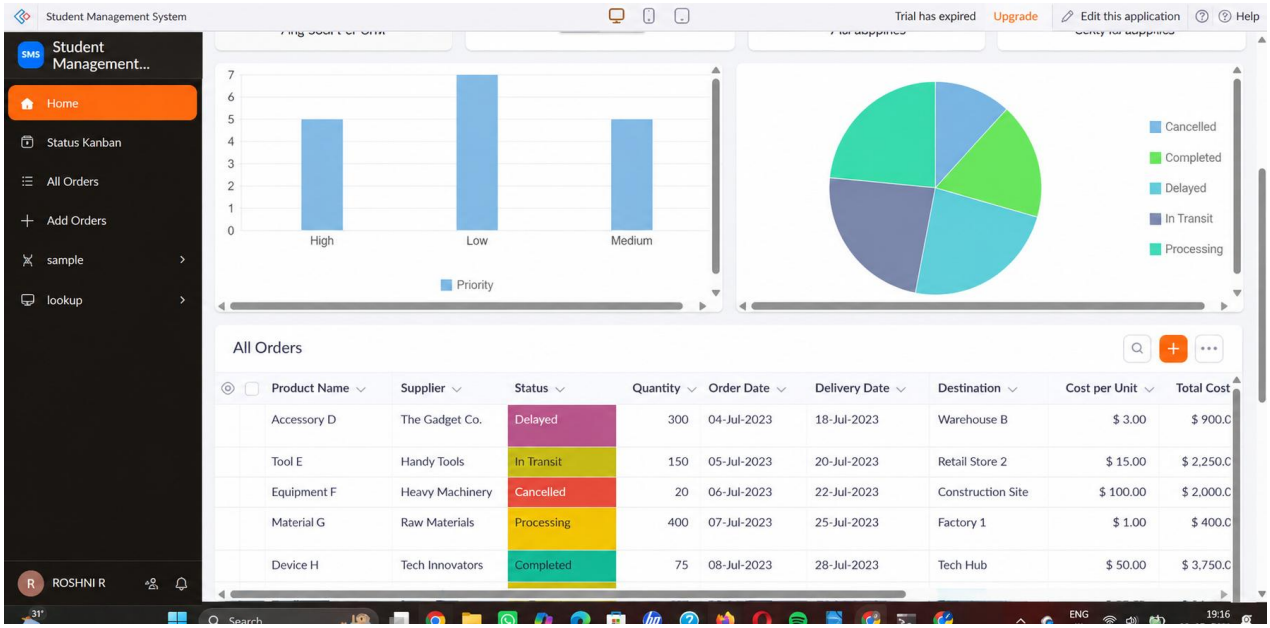

9. **Open UI Builder and customize the form layout:** Open the UI Builder for the form "Enrollment". Rearrange the fields into a two-column layout, group Marks and Result together and adjust the field label alignment. Preview the form.

10. **Apply theme and navigation:** In UI Builder, change the application theme (colours and font), upload a logo, and place the Student_Dashboard as the first item of the application menu. Save and open the application in live mode.

Screenshot 10: Final application UI after customization

RESULT

Thus, the reports Student_List and Enrollment_Result_Board and the dashboard Student_Dashboard were created in Zoho Creator, and the user interface of the application was customized using UI Builder successfully.
